GRAMMAR REPORT

AI-Based Learner Stream Recommendation System

Institution	Vaal University of Technology
Faculty	Applied and Computer Sciences
Department	Computer Sciences
Subject	Business Analysis 3.2 (AIBUY3A)
Academic year	2026
Review type	Grammar, spelling, punctuation, clarity and academic-language review

1. Purpose of the review

This report records a language review of the available project documentation for the AI-Based Learner Stream Recommendation System. The review focuses on whether the writing is clear, grammatically correct, consistent and suitable for an academic project report.

2. Areas reviewed

- Sentence structure and readability.
- Spelling, punctuation and capitalisation.
- Consistency of technical terms and project names.
- Clear explanations of the system, its methods and its test results.
- Academic tone and avoidance of unsupported claims.

3. Language improvements to apply

Area	Recommended improvement
Wordy or unclear wording	Use short, direct sentences and explain technical terms when they first appear.
Inconsistent naming	Write the project name consistently as “AI-Based Learner Stream Recommendation System”.
Technical descriptions	Describe the chatbot as keyword-based NLP; do not call it a trained language model unless that is what the code uses.
Claims about accuracy	Use cautious wording such as “the recorded test result was…” and explain the data-leakage risk.
Long paragraphs	Split paragraphs when they cover more than one idea, especially in the methodology and results sections.
Tables and lists	Use consistent capitalisation, punctuation and sentence style across headings, table entries and bullet points.

4. Project-specific wording checks

The documentation should consistently identify the four recommendation categories as Science, Commerce, Humanities and Technical/Vocational. It should use “Grade 9 learners” and “Grade 10 streams” consistently. The Decision Tree and Random Forest results should be described as marks-only model results. The much higher NLP-only and combined validation figures should be clearly labelled as potentially affected by data leakage and should not be presented as confirmed real-world accuracy.

5. Overall review outcome

The available project-documentation sections communicate the project purpose, technologies, workflow, risks and initial results. The main language improvements are to keep sentences concise, maintain consistent terminology, explain technical terms clearly and use careful wording when discussing model performance. The team should complete a final read-through of the full document after making these changes.

6. Important note about Grammarly evidence

This is a grammar and language review report prepared for the project. It is not an official Grammarly-generated report and does not contain a Grammarly score, certificate or originality result. If the lecturer specifically requires Grammarly evidence, the team must upload the final document to Grammarly, review the suggestions, and attach a genuine screenshot or export provided by Grammarly.
